Special Release Notification: The National Marine Fisheries Service Biological Opinion for the Salinas Valley Water Project uses water year type categories to determine certain operational requirements related to steelhead passage in the Salinas River system. Water year type is forecast on March 15th and April 1st of each year using daily streamflow at the Arroyo Seco near Soledad USGS stream gage. The April 1st forecast for water year 2019 is for a wet year type. For wet year-types, and if the combined reservoir storage is 220,000 AF or more, the MCWRA will provide additional supplemental Salinas River Diversion Facility (SRDF) bypass flows. Since the Salinas River Lagoon (lagoon) is currently open to the ocean, the MCWRA will provide 45 cfs to the lagoon until April 10th, then 15 cfs to the lagoon through June 30th, and then two cfs as long as the SRDF is operating or conservation releases are being made.

Currently, the MCWRA is making conservation releases for groundwater recharge and SRDF operations. For details related to NMFS flow requirements in the Salinas River see:
